

What should I do when my Excellent II from 2005 stops when I am cutting tall grass?

Since 2005 the new generation of Excellent has been fitted with a deep deck which is optimized for the best cutting results. The disadvantage of this is that the machine can stop when cutting very tall grass. This machine therefore has a removable mulcher wall. When this is removed the machine will work like a rear-discharge machine and cope with much more difficult grass, but the cutting result will not be as neat and attractive.

Remove the two screws on the top of the deck holding the mulcher wall. This mulcher wall is normally made in a different colour (and not red as in the picture).
